**Asuhan Kebidanan pada Bayi M usia 2 bulan dengan *Diaper Rash* di PMB R
6 BAB, 51 halaman, 10 lampiran**

ABSTRAK

Diaper Rash merupakan salah satu masalah yang timbul pada kulit bayi berupa ruam merah terang yang disebabkan oleh iritasi dari kulit terkena urin atau kotoran yang berlangsung lama di bagian mana saja dibawah popok. *Diaper Rash* sering terjadi akibat kurangnya kebersihan bayi dan lingkungannya serta rendahnya pengetahuan orang tua mengenai *dermatitis diapers/ruam popok*. Dampak terburuk dari *Diaper Rash* yaitu dapat mengganggu proses pertumbuhan, sehingga asuhan kebidanan harus di berikan kepada Bayi M di PMB Bidan R untuk tindakan perawatan yang tepat agar tidak terjadi *Diaper Rash*.

Metode penulisan yang digunakan adalah laporan kasus. Bentuk pendokumentasian menggunakan SOAP dan teknik pengumpulan data menggunakan metode wawancara, observasi, pemeriksaan fisik, studi dokumentasi dan studi literatur.

Hasil pengkajian saat kunjungan awal Bayi M terlihat rewel dan hasil pemeriksaan, menunjukkan bintik kemerahan pada daerah bokong dan lipatan paha Bayi M. Sehingga ditegakkan analisa yaitu Bayi M usia 2 bulan dengan *diaper rash*. Kemudian dilakukan pemantauan perawatan selama 7 hari, keadaan bayi dinyatakan sembuh dalam perawatan 7 hari.

Kesimpulan hasil asuhan pada Bayi M didapat masalah pada perawatan hygiene dan mengalami *Diaper Rash/ruam popok*. Orang tua Bayi M disarankan agar tetap menjaga personal hygiene terutama pada area genital bayi serta menjaga kebersihan lingkungan agar tidak terjadi *Diaper Rash*.

**Midwifery Care for Baby M aged 2 months with *Diaper Rash* at PMB R
6 chapters, 51 pages, 10 appendix**

ABSTRACT

Diaper rash is one of the problems that arise on the baby's skin in the form of a bright red rash caused by irritation of the skin exposed to urine or feces that lasts for a long time anywhere under the diaper. Diaper rash often occurs due to the lack of hygiene of the baby and its environment as well as the low knowledge of parents about diaper dermatitis/diaper rash. The worst impact of Diaper Rash is that it can interfere with the growth process, so midwifery care must be given to Baby M at PMB Midwife R for appropriate treatment measures so that Diaper Rash does not occur.

The writing method used is a case report. The form of documentation uses SOAP and data collection techniques using interviews, observations, physical examinations, documentation studies and literature studies.

The results of the assessment during the initial visit of Baby M looked fussy and the results of the examination showed reddish spots on the buttocks and groin of Baby M. So that the analysis was enforced, namely Baby M aged 2 months with diaper rash. Then monitoring of care for 7 days, the baby's condition was declared cured in 7 days of care.

The conclusion of the results of care for Infant M obtained problems in hygiene care and experienced Diaper Rash / diaper rash. Parents of Baby M are advised to maintain personal hygiene, especially in the baby's genital area and take care environmental hygiene to prevent Diaper Rash from occurring..
