In the development of pregnancy, childbirth, and the puerperium can be a pathological condition, so that it can cause complications if no early detection is done. Based on Mariana's research (2011) the success of IMD and exclusive breastfeeding can be supported by the active role of husbands in helping to carry out their role as a father in giving ASI to their babies.

Scientific paper is conducted from January to April 2020. Scientific paper uses a case study method involving a pregnant woman with 35-36 weeks gestational age who is given comprehensive midwifery care and a husband who is given health education using booklet about breastfeeding father.

During the midwifery care process, there are several problems during pregnancy including waist heat, that is given midwifery care provided of mechanical body counseling. During the puerperium, mothers and husbands are given health education about breastfeeding father so that mothers can provide exclusive breastfeeding to their babies by getting the role of the husband. Problems in Newborns is prickly heat, midwifery care provided is personal hygiene counseling. All problems are resolved and there are changes after being given midwifery care.
