**GAMBARAN PENGETAHUAN REMAJA SMA TENTANG
PENYAKIT MENULAR SEKSUAL
(LITERATURE REVIEW)**

ABSTRAK

xii, 46 hal, 5 Bab, 1 bagan, 2 tabel, 4 lampiran

Penelitian ini dilatarbelakangi oleh meningkatnya angka kejadian penyakit menular seksual pada remaja. *World Health Organization* tahun 2013 menyatakan lebih dari 1 juta orang menderita penyakit menular seksual setiap hari. Golongan umur yang memberikan kontribusi besar ialah orang muda berusia 15-24 tahun. Survei kesehatan reproduksi remaja di Indonesia menunjukkan bahwa sebanyak 35,5% remaja perempuan dan 31,2% remaja laki-laki usia 15-19 tahun kurang mengetahui penyakit menular seksual. Penelitian ini bertujuan untuk mengetahui gambaran pengetahuan remaja SMA tentang penyakit menular seksual. Jenis penelitian yang digunakan adalah deskriptif dengan desain penelitian *literature review*. Teknik pengambilan data yaitu data sekunder dengan empat sampel jurnal. Hasil penelitian menunjukkan bahwa jurnal 1 pengetahuan remaja tentang penyakit menular seksual cukup sebesar (70,2%) 59 orang, jurnal 2 pengetahuan cukup sebesar (62,63%) 119 orang dan jurnal 3 pengetahuan cukup sebesar (79%) 34 orang. Kemudian 1 dari 4 jurnal menyatakan bahwa pengetahuan remaja SMA tentang penyakit menular seksual baik yaitu jurnal 4 pengetahuan baik sebesar (60%) 24 orang. Dapat disimpulkan bahwa sebagian besar pengetahuan remaja SMA tentang penyakit menular seksual cukup. Direkomendasikan kepada profesi keperawatan untuk melakukan kegiatan pendidikan kesehatan kepada remaja SMA melalui sekolah untuk meningkatkan pengetahuan tentang penyakit menular seksual.

**DESCRIPTION OF HIGH SCHOOL TEENAGE ABOUT
SEXUALLY TRANSMITTED DISEASE
(LITERATURE REVIEW)**

ABSTRACT

xii, 47 pages, 5 chapters, 1 chart, 2 tables, 4 attachments

This research is motivated by the increasing incidence of sexually transmitted diseases in adolescents. The World Health Organization in 2013 stated that more than 1 million people suffer from sexually transmitted diseases every day. The age group that makes the biggest contribution is young people aged 15-24 years. Adolescent reproductive health surveys in Indonesia show that as many as 35.5% of female adolescents and 31.2% of male adolescents aged 15-19 years do not know about sexually transmitted diseases. This study aims to describe the knowledge of high school adolescents about sexually transmitted diseases. The type of research used is descriptive with a literature review research design. The data collection technique is secondary data with four journal samples. The results showed that journal 1 had sufficient knowledge of adolescents about sexually transmitted diseases (70.2%) 59 people, journal 2 had sufficient knowledge of (62.63%) 119 people and journal 3 had sufficient knowledge of (79%) 34 people. Then 1 out of 4 journals stated that high school youth knowledge about sexually transmitted diseases was good, namely journal 4 good knowledge (60%) 24 people. It can be concluded that the majority of high school adolescents' knowledge of sexually transmitted diseases is sufficient. It is recommended for the nursing profession to carry out health education activities for high school youth through schools to increase knowledge about sexually transmitted diseases.
