**ASUHAN KEBIDANAN KOMPREHENSIF PADA NY.R DI KABUPATEN
CIANJUR TAHUN 2022**

ABSTRAK

xiv + V BAB + 205 Halaman + 4 Lampiran.

Anemia, preeklamsia, perdarahan, infeksi nifas, dan aspiksia merupakan beberapa komplikasi yang dapat terjadi selama kehamilan sampai nifas yang dapat membahayakan bagi ibu maupun bayi. Dengan dilakukan asuhan kebidanan komprehensif diharapkan dapat mendeteksi secara dini, mencegah dan menangani komplikasi-komplikasi tersebut. Tujuan dari penyusunan tugas akhir ini adalah memberikan asuhan kebidanan komprehensif dengan penerapan manajemen kebidanan.

Laporan Tugas Akhir ini berupa studi kasus dengan memberikan asuhan kebidanan kepada Ny.R sejak usia kehamilan 37 minggu sampai dengan masa nifas dan bayi baru lahir yang di laksanakan di Kabupaten Cianjur pada bulan April-Mei 2022.

Selama kehamilan, klien mengalami obesitas sehingga dianjurkan untuk berkonsultasi kepada dokter obstetri dan ginekologi, mengkonsumsi makanan rendah lemak dan karbohidrat serta melakukan aktivitas fisik seperti senam atau berjalan-jalan selama 15 menit perhari. Kenaikan berat badan klien sesuai dengan standar kenaikan berat badan selama masa kehamilan. Terdapat kesenjangan antara teori dengan praktik yaitu pemberian antibiotik pada masa nifas dengan robekan perineum derajat 1. Tidak ada masalah yang ditemukan selama asuhan persalinan dan bayi baru lahir.

Asuhan kehamilan, persalinan, nifas dan bayi baru lahir sudah dilaksanakan sesuai standar. Pemberi pelayanan diharapkan lebih meningkatkan kompetensinya dalam memberikan asuhan kebidanan komprehensif serta deteksi dini kepada klien yang dikelolanya sesuai dengan *evidence based*.

**COMPREHENSIVE MIDWIFERY CARE OF MRS. R AT CIANJUR
REGENCY 2022**

ABSTRACT

xiv + V Chaptest + 205 Pages + 4 Attachment

Anemia, preeclampsia, bleeding, puerperal infection, and asphyxia are some of the complications that can occur during pregnancy up to the puerperium which can be dangerous for both mother and baby. With comprehensive midwifery care, it is hoped that early detection, prevention and management of these complications will be possible. The purpose of this scientific paper is to provide comprehensive midwifery care with the application of midwifery management..

This scientific paper is in the form of a case study by providing midwifery care to Mrs. R from 37 weeks of gestation until the puerperium and newborns held at Cianjur Regency in April-Mei 2022.

During antenatal care, the client was identified as obese, so it is recommended to consult an obstetrician and gynecologist, consume foods low in fat and carbohydrates and perform physical activities such as exercise or walking for 15 minutes/day. The client's weight gain was in accordance with the standard of weight gain during pregnancy. There is a difference between theory and practice, namely giving antibiotics to mothers with first-degree perineal tears. No problems were found during maternity care and newborn care.

Antenatal care, maternity care, postpartum care and newborn care have been implemented based on midwifery management and service standards. There is a difference between theory and practice, namely giving antibiotics to mothers with first-degree perineal tears. It is hoped that it can improve interprofessional collaboration and be more proactive in providing comprehensive midwifery care so that the goals of care are achieved optimally
