Family Empowerment Model Could Enhance Ability to reduce the Impact of Disasters on Pregnant Women

Abstract (Maximum 250 Words)*
Vulnerable groups, such as pregnant women, are a group that is at risk of health problems during a disaster. Weak physical condition due to the impact of the disaster and high anxiety can cause contractions that can lead to miscarriage, premature birth, and labor that is earlier than it should be. Family involvement as community empowerment, so that the family as the smallest unit can recognize as early as possible the risks, disastrous impacts of pregnant women. This research consists of three stages. Stage 1 is an exploratory study. The second stage is model development. A Disaster Response Pregnant Mother Family Empowerment Model was developed and used to increase the ability to face disasters in the context of reducing the risk of pregnant women in disaster conditions. Family mentoring uses the empowerment model for disaster response families twice with a span of one week. The third stage of the research was a quasi-experiment with pre-post test two group designs. Samples per group are 20 people. The sampling technique was the purposive sampling technique. The pre-post test was conducted to determine knowledge and attitudes, using a questionnaire, while the skills used observation. In the control

- Paper Title** Quality of Life with Psychosocial Assistance of Chronic Renal Failure (CRF) with Hemodialysis in The City of Bogor
- Area of Research** Nursing
- Paper Issue** Volume-54, Issue- 11
- Abstract**

Chronic kidney disease includes conditions that damage the kidneys and decrease their ability to keep them healthy. Kidney disease patients have no symptoms at all. At the worst, patients can be threatened with life if they do not undergo periodic hemodialysis or kidney transplantation to replace their severely damaged kidney organs. CKD patients who reach the final stage will experience a condition that causes disability, poor quality of life, and expensive social and financial costs. The study aimed to identify psychosocial assistance on patients' quality of life with chronic renal failure. This research is a quantitative study using a quasi-experimental method with the one group pre-test-post test design approach. Data collection using the WHOQOL quality of life questionnaire was then carried out psychosocial mentoring. Respondents were patients with chronic renal failure with hemodialysis, amounting to 34 people. The sampling method used purposive sampling. This study indicated that the quality of life significantly increased with p-value = (0.001). Domains that have increased are psychological domain p-value = (0.001) and environmental domain p-value = (0.001). The physical health domain (p = 0.639) and social domain (p = 0.751) did not change significantly. Many psychosocial problems occur in CRF patients with hemodialysis. Urgently needed support from family and community to improve
